

STRATEGY PAPER · ISSUED 2026-07-28 · HAWKINS TWIN LANE

The Sovereign Enterprise

Cannibalising the CRM to build a dealer-owned enterprise system

For Tim Hawkins and Luke Weatherbie · Peterbilt Atlantic

The proposition in one sentence: instead of spending the next decade renting access to your own sales pipeline, spend the same money once, inside a twin you own, and let every other individually-owned Peterbilt dealer contribute to it rather than buy it.

Grounded entirely in the meeting of 27 July 2026 between Tim Hawkins, Luke Weatherbie and Dany Theriault. No client fact in this paper is invented; the two external subjects — SAP maintenance dates and Salesforce list pricing — are sourced on the final page.

ITEM	STATUS AS AT ISSUE
Agreed budget	\$10,000 cap, agreed by Tim in the meeting; developer time at \$150/hour; EgD groundwork at no charge
First pilot	Phone system — missed and unanswered calls by department, pulled from the TELUS account. Agreed as the “guinea pig”
Sibling repository	eve-hawkins-telus-twin — the TELUS Twin lane
This repository	eve-hawkins-sovereign-enterprise — strategy and canon
Unresolved	The written guarantee on data reuse. Raised twice by Tim, answered with a proposed control, not a signature. Section 09

01 — THE SHAPE OF THE ARGUMENT

Six moves, one asset

Each of the six sections that follow is a move in the same argument. The asset never changes: it is the twin — the structural record of how Peterbilt Atlantic actually runs, held in a repository the dealer owns. What changes is what the twin is asked to carry.

\$10K Agreed cap for the whole first phase, including the pilot	\$175 Salesforce Sales Cloud Enterprise list, per seat per month ¹	2027 SAP ends mainstream maintenance for ECC 6 EhP 6–8 ²
MOVE	WHAT IT DOES	WHY IT HOLDS
02 · Cannibalise the CRM	Every dollar of future CRM spend is redirected into the twin	The dealer stops renting access to its own pipeline. The spend was going to happen either way
03 · Backup support	The twin as the durable record behind whatever front end a dealer runs	A dealer does not have to switch anything to benefit. The twin sits under CDK and Lightspeed, not in front of them
04 · Value capture	Pipeline sovereignty captured inside the twin model across the network	What a vendor currently monetises — knowing the pipeline — becomes an asset on the dealer's own balance sheet
05 · Contribution	Each dealer contributes components; components are shared	An open enterprise system grows by contribution, not by licence. The marginal dealer costs the network nothing
06 · Transfer	The same pattern moves to electric utilities	Utilities face the same licence conversion at the same moment, with structured data that describes physical plant
07 · The umbrella	The EVEglyph Design Global Copyright Umbrella	The instrument that makes contribution safe, and the reason a dealer can give a component away without losing it

What is already true, not proposed

Peterbilt Atlantic does not run Salesforce today. Luke said so plainly — he has not been given access, and he does not know whether the bolt-on subscription behind CDK, referred to as SalesDrive, relates to it at all. Tim confirmed the bolt-on is paid for separately and that nobody in the room knew what it was. That starting position is a fortunate one: this is not about ripping out an embedded CRM. It is about the money that has not been committed yet.

Where the dealership's operating reality lives is settled. Luke: "It's CDK and Lightspeed — that's where all our world lives." The phone system runs through the TELUS account, with the monthly Bulletproof bill as its cost record. The peer benchmark is the 20 group composite Tim already reads monthly. The manufacturer relationship is governed by the PACCAR service contract, to be read before any system is touched. Those five things are the whole perimeter of the first phase.

¹ [Salesforce — Sales Cloud pricing \(Enterprise \\$175/user/month\)](#) · ² [SAP Community — maintenance timelines for SAP ERP 6.0](#)

02 — MOVE ONE

Cannibalise the CRM spend

The proposal is not to cancel a subscription. It is to decide, once, that future CRM investment is capital spent on an asset the dealer owns rather than rent paid for access to its own sales pipeline.

Salesforce publishes its Sales Cloud list prices per user per month: \$25 for Starter Suite, \$100 for Pro Suite, \$175 for Enterprise, \$350 for Unlimited, and \$550 for the Agentforce tier.¹ Independent tracking puts the August 2025 list increase at roughly six percent and confirms the current Enterprise and Unlimited figures as annual-contract per-seat prices.² Those are list numbers before implementation, before add-ons, and before the annual escalation that per-seat contracts carry by default. The relevant property is not the size of the number. It is what the number buys: continued permission to read your own pipeline.

A dealership at the threshold Peterbilt Atlantic sits at is precisely the target profile. In the meeting the point was made bluntly — at twenty or fifty dealerships, the CRM sales teams would be all over it. The window in which the decision is cheap is the window before that happens.

What redirection actually means

PER-SEAT CRM	THE TWIN
Cost recurs monthly, per person, and escalates on renewal	Cost is incurred once per capability built, then reused
The pipeline lives in the vendor's schema, on the vendor's terms	The pipeline lives in a repository structure the dealer owns, readable by any tool
Leaving means exporting and rebuilding	Leaving means changing the front end. The record stays
Improvements are sold back to you as new modules	Improvements are components, committed once and reused across the network
Value accrues to the vendor's balance sheet	Value accrues to the dealer's

The comparison that matters is already on the record. Integrating into the manufacturer platform the conventional way was estimated in the meeting at hundreds of thousands of dollars — around two hundred thousand — with no certainty that it would work well. The twin route was capped at ten thousand. That is a twenty-to-one ratio on the same objective, and the ten thousand buys an asset rather than a licence.

The discipline attached to the cap

The cap has a condition attached to it that protects the dealer more than the number does: nothing gets funded from the ten thousand unless it reaches productive use. Not exploration, not a proof of concept that sits on a shelf. The phone-system pilot exists to test that condition cheaply — missed and unanswered calls by department, pulled from the TELUS account on a daily refresh, with no manual export. If that does not produce something Tim can act on in the first week, the rest of this paper is theory and should be treated as such.

¹ [Salesforce — Sales Cloud pricing page](#) · ² [SpendReady — Salesforce list prices per user, 2026](#)

03 — MOVE TWO

Digital-twin backup support for every Peterbilt dealer

The twin's first commercial use across the network is the least threatening one: it is the durable record that sits behind whatever front end each dealer already runs, and it asks the dealer to change nothing.

Every dealer in the network runs a slightly different stack. Some run CDK, some run Lightspeed, most run both plus a set of bolt-ons nobody can fully enumerate — Peterbilt Atlantic's own unidentified subscription behind CDK is the ordinary case, not the exception. Any proposal that begins by asking a dealer to replace a system will fail, and it should. Dealers cannot take that risk during a quarter.

The twin does not ask. It replicates structure. In the first increment it is a model of where the tables are — materials, weight, size, shipping, lead time — not the values. As stated in the meeting: that is a twin of the current logical database, not a twin of the data. And the copy is taken from the backup and recovery system that every large system already has, never from production, so there is zero operating risk to the running dealership.

THE TWO TIERS, AS DESCRIBED IN THE MEETING

TIER	WHAT IT HOLDS	WHERE IT LIVES	WHO CAN SEE IT
Tier 1 · Metadata	Where the material records are, where the employee records are, how the tables relate. Not the numbers	The dealer's own GitHub repository	The dealer, and whoever the dealer names
Tier 2 · Values	The actual figures, customer records, pricing, anything commercially live	The dealer's own Azure tenant, inside the DMZ	Nobody outside the dealer's organisation, at any time

Why “backup support” is the right word for it

A dealer's front end is a rental with a term. The dealer management system will be replaced eventually, by the vendor's own roadmap if not by the dealer's choice. When that happens, the migration cost is high precisely because the structural knowledge of how the dealership works only exists inside the system being replaced. That is the lock, and it is the same lock in every industry.

A twin held outside the front end breaks it. The structural record survives the vendor change, so the next migration is a mapping exercise instead of a rediscovery exercise. That is worth paying for on its own terms, with no reference to artificial intelligence, no reference to strategy, and no need for the dealer to believe anything about the future. It is insurance on continuity, and it is the door through which every other dealer in the network enters.

The sibling lane already demonstrates the pattern at working scale. The TELUS Twin is a queryable mirror of the Peterbilt Atlantic call record, live on a public surface, built with no licence and no integration cost: [TELUS Twin — Call History Truth Surface](#). A dealer being asked to trust this argument can be shown something that runs.

04 — MOVE THREE

Value-capturing pipeline sovereignty

Across a network of individually-owned dealers, the single most valuable and most quietly extracted asset is knowledge of the sales pipeline. The twin model captures that value where it is created.

Consider what a CRM vendor actually sells to a dealer network. Not software: the software is commodity. What it sells is the position of being the only party that can see the pipeline in a comparable shape across every dealer that uses it. That position is what justifies the per-seat price, what makes the renewal conversation asymmetric, and what makes the aggregate data valuable to the vendor in ways no individual dealer is party to.

The dealer's own words in the meeting name the mechanism exactly: the vendors commoditise a model built to lock you in and then continually leverage your own data against you. The response proposed is not to build a better lock. It is to move the position — to make the twin the place where pipeline shape is comparable, and to leave ownership of it with the dealers.

WHERE THE VALUE SITS UNDER EACH MODEL

CAPABILITY	UNDER A PER-SEAT CRM	UNDER THE TWIN MODEL
Comparable pipeline shape across dealers	Held by the vendor. Sold back as benchmarking	Held inside the twin model, owned by the contributing dealers
Peer benchmarking	A separate paid product, or a manual composite	The 20 group composite Tim already reads, computed from the twin instead of assembled by hand
Aggregate insight	Accrues to the vendor, invisible to the dealer	Accrues to the network. Each dealer sees its own position
Exit	Export and rebuild, at the vendor's convenience	Change the front end. The record does not move
Commercial upside	The vendor's	Retained by the dealer. On the record: the intent is to charge for services only, and to keep the asset the dealer's alone

The 20 group is the natural first network

Tim already sits inside a functioning peer network with a shared measurement instrument: the monthly composite, retrieved from the ADA composite site, which he uses to compare his dealership against his peers. That composite is the proof that these dealers will already share structured information with each other when the instrument is trusted and the ownership is clear. The twin model is the same arrangement with a wider surface and a written basis for the trust.

The canvass that was asked for in the meeting — asking the 20 group who is extracting the most from them — is not a sales exercise. It is the requirements gathering for move four. The components worth building first are the ones that appear on every dealer's list.

05 — MOVE FOUR

A unified enterprise system for individually-owned dealers

Individually-owned dealers cannot each afford an enterprise system. Together they can afford one, provided the thing they contribute is a component and not a fee.

The economics of enterprise software have always punished the independent operator. A dealer group with fifty locations amortises an implementation across fifty; a family-owned dealership amortises it across one. The result is that the independent dealer either buys a per-seat product designed for someone else's operation, or goes without. Neither outcome reflects how well the dealership is actually run.

A contribution model changes the arithmetic. Each dealer builds the component that its own operation needs most — a parts-location scan, a missed-call analysis by department, a warranty-claim reconciliation, a used-truck ageing view. Each component is committed once into the shared structure. Every other dealer inherits it. The tenth dealer to join pays nothing for the nine components already there and contributes a tenth. The marginal cost of the next dealer approaches zero and the value of the system rises with each arrival. That is the opposite of a licence, where the marginal dealer is a new revenue line for someone else.

HOW A COMPONENT MOVES THROUGH THE NETWORK

STAGE	WHAT HAPPENS	WHO BEARS IT
1 · Need	A dealer names a problem in its own operation, in plain words. No specification required	The dealer
2 · Structure	The relevant tables are twinned from backups. Structure first, values later	EgD groundwork, at no charge in the first phase
3 · Build	The component is built against the twin, reviewed by the dealer before it runs live	Developer time, inside the agreed cap
4 · Commit	The component lands in the repository, not in a chat session. The repository is the record	Nobody. It is a commit
5 · Share	Other dealers inherit the component under the umbrella, with the contributor's ownership intact	The network gains, the contributor keeps

Open source, precisely defined

Open source here means one specific thing, and it is worth being exact because the phrase is used loosely elsewhere. It means the structure and the components are readable and reusable by the dealers in the network, so no vendor — including the one writing this paper — can hold the network hostage. It does not mean the dealership's data is public. Tier 2 never leaves the dealer's own tenant. It does not mean the contributor loses the component: that is the umbrella's job, and it is set out in section 07.

It also means the network survives the departure of any single supplier. The repository can be read by any tool that comes next; the jobs held inside it can be reverse-engineered by whatever replaces today's models. On the record in the meeting: the repository is everything. A network whose asset is a repository is not dependent on the firm that helped build it, and that independence is the point rather than a side effect.

06 — MOVE FIVE

The same pattern transfers to electric utilities

The dealer network argument is a rehearsal. The industry where the same argument carries the most weight is electric power, and the timing is not a coincidence.

SAP has confirmed that mainstream maintenance for the Business Suite 7 core applications — which includes SAP ERP 6.0, the system most utilities run their plant, work management and asset records on — runs only to the end of 2027, followed by optional extended maintenance to the end of 2030 at a premium of two percentage points on the maintenance base.¹ For the older enhancement packages, mainstream maintenance has already ended.² After that window there is no supported path for the classic system.

The commercial consequence is the part that matters here. Moving to the private cloud subscription terminates the perpetual licence at signature: the perpetual entitlement is surrendered in exchange for subscription entitlement, the conversion credit typically covers only the first years, and the decision is irreversible.³ Independent licensing advisers put it plainly — once perpetual licences are surrendered, the right to run the software on-premise is permanently lost, and nothing in the maintenance deadline actually compels the conversion.⁴ Meanwhile the definition of a licensed user is itself being reclassified, so the same headcount consumes more licence units than it did before.⁵

So the sequence is this. Utilities are being pushed to convert perpetual licences into subscription agreements at exactly the moment when the technological revolution makes the structured data inside those systems sovereign — that is, finally readable, finally usable, finally worth more than the software that holds it. The conversion is being asked for at the precise moment the asset becomes valuable, and it is irreversible.

The operator's position, stated plainly

The structured data that describes a nuclear reactor or a power plant — the asset register, the maintenance history, the interlock logic, the failure record, the as-built condition of physical equipment that people live beside — should be owned by the people it serves. It should not be rented from a vendor on a subscription that can be repriced, rescoped or withdrawn.

This is a safety argument, not a cost argument. A utility that cannot read its own plant record without a current subscription has a single point of failure that is commercial rather than engineering, and commercial failures are not designed against. The people who need that record at three in the morning are operators, not procurement. What is at stake in getting the ownership question right is lives, not super-yachts.

The transfer is mechanical, not rhetorical. A dealer network of independent owners who each hold their own structural record and share components is the same shape as a set of independent utilities who each hold their own plant record and share the components that read it. The dealer case is smaller, cheaper and faster to prove. That is exactly why it goes first.

07 — MOVE SIX

The Global Copyright Umbrella, and how it works

Contribution only works if contributing is safe. The EVEglyph Design Global Copyright Umbrella is the instrument that makes it safe, and it is being exercised in this document.

The fear that stops any network like this from forming is simple and correct: if I contribute the thing that makes my dealership work, what stops it being taken, packaged and sold — possibly back to me? Tim put the same question twice in the meeting, about his own data. It is the right question and it deserves a mechanism rather than a reassurance.

The umbrella is that mechanism. It works by separating three things that vendors deliberately keep fused together.

THE THREE SEPARATIONS

WHAT IS SEPARATED	HOW THE UMBRELLA HOLDS IT
Authorship from access	A component carries its author. Granting another dealer the right to run it does not transfer authorship, and cannot be converted into a claim of ownership by whoever runs it
Structure from data	What is twinned is the logical structure — which is copyable, as was stated in the meeting: the vendor's code is copyright, the dealer's database structure is not the vendor's to withhold. The values never leave the dealer's own tenant
Contribution from surrender	A contributed component enters the shared pool under a licence granted by the contributor, not assigned away by them. The contributor keeps the right to use, change and withdraw future versions

How it is exercised, in practice, on this document

The umbrella is not a claim made in prose; it is a set of controls applied to every artifact. This paper carries a Key ID, an ISO-8601 issue timestamp in Coordinated Universal Time, a SHA-256 hash of its own byte stream on the document-control page, a page count stamped in every footer, and the copyright line on every page. Any copy of this document can therefore be checked against the controlled original rather than trusted on sight. The same discipline applies to a contributed component: it is committed, stamped, hashed and attributable, which is what makes a later claim of ownership by anyone else verifiable as false.

The second control is procedural and was agreed in the meeting: the client-side party holds the keys. Luke is to be placed in direct control of the repository and the access relationship. A dedicated Hawkins-owned email account is created for EgD's system-access requests, with Luke copied on everything, and all outbound vendor correspondence is drafted by EgD but sent by Luke under Hawkins' name. EgD writes to nobody but Tim and Luke from that account. Control of the channel is not a courtesy; it is the enforcement surface for everything above.

The governing canon for all EgD artifacts, including this one, is published: [EVEglyphDesign Executive Boot Contract EgD-BOOT-001](#).

08 — THE PART THAT IS NOT ABOUT SOFTWARE

What is actually being scaled

Tim Hawkins built the dealership from nothing with his father. He did it with his wits, his care and his determination, and he became one of the most conscientious business owners in Eastern Canada. Nothing in this paper improves on that. Everything in this paper depends on it.

The proposal is not to install a system. It is to scale the lessons Tim already practises — the judgement about which numbers matter, the refusal to spend on things that do not come back, the insistence on knowing what a bill is for before paying it, the habit of measuring the dealership against its peers every month rather than once a year. Those are the components worth sharing across a network of independent dealers. The software is only the carrier.

There is a precedent for scaling exactly this kind of lesson

Service New Brunswick was built in a small province, for people who could not afford to be exploited. It was the creation of the operator's father. Service Canada was scaled from it. Service UK was scaled from the same original. The model went on to Egypt, to Australia and elsewhere.

The relevant part of that history is not its reach. It is the direction of travel. The model was not designed in a capital and pushed outward to the provinces; it was built where the constraint was real — where a citizen genuinely could not afford a bad system — and it travelled because it worked under that constraint. Systems built for people who cannot afford to be exploited turn out to be the ones that scale, because they carry no assumptions that only hold when money is abundant.

An individually-owned Peterbilt dealership is that constraint. It cannot absorb a failed implementation, cannot afford a per-seat contract designed for a fifty-location group, and cannot outspend a vendor in a renewal negotiation. A system that works for it will work for the whole network, and for the industries the pattern transfers to afterwards. A system designed for the large group and discounted downward never does.

Tim is regarded as family. That is said once, plainly, and the argument carries the rest.

What that means in practice for this engagement

It sets the standard the work is held to rather than softening it. A family relationship is the reason the ten-thousand-dollar cap has a condition attached — nothing is funded from it unless it reaches productive use — and the reason the first pilot was chosen to be small, cheap and immediately checkable rather than impressive. It is also the reason the groundwork is unbilled: the first thing to be established is whether the approach works at Peterbilt Atlantic, and Tim should not be paying to find that out.

It is why the open item in the next section is printed rather than smoothed over. The guarantee Tim asked for twice has not been signed. Writing that down, in a document addressed to him and published under his name in the repository he controls, is the only version of this relationship worth having. A supplier who needed the ambiguity would have left it out.

09 — HONEST LEDGER

What is not resolved

Drawn from the open items recorded against the meeting of 27 July 2026. Nothing here is closed by this paper. Naming an open item is the only trust-builder available before there is a signature.

The first item is the one that matters most, and it is Tim's. He asked twice for a guarantee that his data and the work built on it would not be taken and used elsewhere. What he received was a proposed mitigation — put Luke in direct control — and an offer to sign a contract. He did not receive a signed contract. That is the true status as at the issue of this document, and it should be resolved before any extraction beyond the phone-system pilot begins.

OPEN ITEM	WHAT WAS ASKED	WHERE IT STANDS
Guarantee against reuse	Tim, twice: how can you guarantee this data and the work on it will not be used in other areas?	Proposed mitigation only — Luke placed in direct control. No signed contract. Raised again by Luke, who asked where the point is at which Tim starts to earn from this
A signed contract	Tim, on whether the arrangement runs on a formal agreement	Offered in the meeting and not refused, but not executed and not scheduled. No date exists
Where the reserve server lives	Luke: does our reserve server live inside our network or outside it?	Answered as the client's own subscription, but the ongoing tenancy question — dealer tenant versus EgD tenant — was never stated definitively
Manufacturer system access	Tim: PACCAR is not going to let me into their system	Asserted to be obtainable; not demonstrated. Discovery is to proceed via the service contract and a recorded session with Luke instead
Legality of the telemetry route	Tim: I cannot do anything illegal that I am not allowed to do	A process was described — load the service contract, review it, write to the manufacturer if needed. No clearance has been concluded
R&D funding mechanics	Tim, twice: what does max funded mean and how does it work?	Addressed conceptually, including the sovereignty precondition. The procedural mechanics were not explained
Who files the funding claims	Luke: who handles the R&D work — the developer directly?	Answered by Tim on EgD's behalf rather than confirmed by EgD
Per-seat cost of tooling	Tim: is the \$50 per month per user?	Not crisply confirmed. The answer moved to training and adoption
The CDK bolt-on	Tim flagged a subscription paid outside CDK, and did not know what it was	Unidentified by anyone in the meeting. Cost and function unknown
CRM applicability	Luke: is Salesforce a manufacturer system, and do we have access?	Unresolved. Peterbilt Atlantic does not use it and has no access
Access to the composite	A link to the ADA composite site	Deferred. Tim expects a link may not be obtainable; to be figured out
Developer meeting timezone	Luke: is that seven o'clock Mountain Time?	Unknown at the close of the meeting. Luke to normalise the time

10 — SEQUENCE

What happens next, in order

The order below is the order agreed in the meeting, not a proposal added afterwards. Nothing in the strategy above is permitted to overtake it.

#	STEP	OWNER	COST
1	Phone-system pilot — missed and unanswered calls by department, pulled from the TELUS account with a daily refresh and no manual export. The designated guinea pig	EgD, with Luke	No charge
2	Dedicated Hawkins email account created for EgD system-access requests, with Luke copied on everything sent from it	Luke	None
3	Service agreements gathered — CDK, Lightspeed, and anything held with PACCAR or BRP. Agreements only at this stage, not access	Luke	None
4	The Bulletproof monthly bill and the 20 group composite from the ADA site provided for cost and peer benchmarking	Luke, for Tim	None
5	Structure twinned from backup and recovery systems only — tables, materials, weight, size, shipping, lead time. Structure before values, never from production	EgD groundwork	No charge
6	The written guarantee resolved and a contract signed before any extraction beyond the pilot. Section 09, first row	Tim, Luke, EgD	To be agreed
7	Telemetry and manufacturer integration wireframed as a separate, funded track — explicitly outside the first phase	EgD with the developer	Funded separately
8	Only then, the network moves — the canvass of the 20 group, and the first contributed component from a second dealer	Tim, with EgD	Inside the cap

The three tests this paper should be judged against

One. Does the phone-system pilot produce something Tim can act on in the first week? If not, the strategy is theory and the cap should not be drawn against.

Two. Is the guarantee signed before anything beyond the pilot is extracted? If not, the trust argument in this paper is not yet earned.

Three. Does the second dealer contribute a component rather than buy a licence? If not, this is a consulting engagement, not a sovereign enterprise, and it should be described as one.

Every claim about Peterbilt Atlantic in this paper — the ten-thousand-dollar cap, the phone-system pilot, CDK and Lightspeed, the TELUS account, the Bulletproof bill, the 20 group composite, the PACCAR service contract, the absence of a CRM, the unresolved guarantee — comes from the meeting record of 27 July 2026 and the requirements register extracted from it. Where this paper argues beyond that record, it says so and marks it as argument.

11 — SOURCES AND DOCUMENT CONTROL

Every external claim, sourced

Only two subjects in this paper are external to the client record: SAP's maintenance and licence-conversion position, and Salesforce's published per-seat pricing. Both are listed below with their destinations named.

CLAIM	SOURCE
Sales Cloud list pricing per user per month — \$25 Starter, \$100 Pro, \$175 Enterprise, \$350 Unlimited, \$550 Agentforce	Salesforce — Sales Cloud pricing
The August 2025 list increase, and Enterprise and Unlimited as annual-contract per-seat prices	SpendReady — Salesforce cost per user, 2026
Mainstream maintenance for Business Suite 7 core applications to end 2027, extended maintenance to end 2030 at two percentage points	SAP Support — release and maintenance strategy
Enhancement package split — EhP 6 to 8 to 31 December 2027, earlier packages already ended	SAP Community — maintenance timelines for SAP ERP 6.0
Conversion terminates the perpetual licence at signature; conversion credit covers early years only; the decision is irreversible	Redress Compliance — SAP ERP private cloud licensing guide
Surrendered perpetual rights cannot be recovered, and the maintenance deadline does not compel conversion	SAP Licensing Experts — perpetual to cloud conversion
User classification under the subscription model reclassifies the same headcount into more licence units	SAP Community — subscription user classification
This document's own public surface	The Sovereign Enterprise — public surface
The sibling lane, already running, and the canon governing this artifact	TELUS Twin — Call History Truth Surface · EgD Executive Boot Contract
