

The ICP

They own their trucks. They rent their data.

One sentence. An owner-operated distributor with a real asset base, whose operating data sits inside somebody else's system of record, and who pays every month for permission to see it. First market: individually-owned heavy-truck dealers in the PACCAR network — three to twenty rooftops, founder or family still at the table.

What qualifies them, in their own words

LISTEN FOR	WHY IT QUALIFIES
The owner is in the meeting	One conversation decides. No procurement committee, no CIO defending a stack he chose.
"It's CDK and Lightspeed — that's where all our world lives"	Their operating record lives in a platform they do not control. Every question they ask about their own business is a request.
Bolt-ons billed separately	Spend is fragmented and nobody holds the total. The spend review lands the moment you add it up in front of them.
They buy trucks, buildings, tooling	They already think in capital terms. That vocabulary is the entire sale — you are not teaching it to them.
A dispute they cannot settle from their own records	Policy, warranty, a customer who says they called. This is the door. It is urgent, it is cheap to answer, and it is theirs.

Not the ICP: anyone shopping for a CRM; anyone who wants seats; private-equity platforms mid-flip, whose exit horizon is shorter than the asset takes to build.

The one thing that scales

Not a suite — a single answer every dealer principal already wants: did the customer call when they said they did, how many times, and who did they actually reach? Built and live for Peterbilt Atlantic in days, with no integration into the DMS and no risk to anything in production — [see the working surface](#). Small, universally understood, adoptable in a week. The door, not the product.

Once that surface is trusted, we are shown the IT spend line. That is the real engagement: converting rented OPEX into an owned capital asset on their balance sheet. One dealer is a consulting fee. The pattern is an asset — [the full strategy paper for Tim Hawkins](#).

On Salesforce — plainly

We are not selling against it and do not need to. Peterbilt Atlantic does not run it. Salesforce is pure subscription: excellent software, zero capital appreciation, nothing on the balance sheet after ten years of payments. We are a counterbalance in the CFO's numbers, not a competitor in the funnel — and the larger gap may prove to be in the traditional enterprise and logistics stack rather than CRM at all. **Your book is not the target.** What we want is the informal network — the people who know these accounts from the inside and become available.

Where the value accrues — the question behind the question

Services revenue is the visible line and it is real. But the appreciating asset is the shared component library: each dealer contributes once, every dealer draws on it, held under the EVEglyph Design global copyright umbrella so no contributor loses what they gave. Equity participation sits at that asset layer — not at the services layer, where there is nothing to appreciate. Numbers stay off paper until the lane is bounded.

The qualifying question, for use on a call: "Do you own your trucks and rent your data?" If the answer is yes and the owner is the one saying it, that is the ICP.
